

Optional cluster fly tray for use with Exocutor 30

As part of the market leading range of insect light traps (ILTs) available from Pelsis, we offer an optional cluster fly tray, which can be used with the Insect-O-Cutor® Exocutor 30.

The cluster fly tray provides a significantly deeper area for caught insects to be retained in, making it appropriate for use with cluster flies, which can appear in high volumes, typically in late summer / early Autumn.

As with all electric ILTs, users should undertake their own risk assessment of the intended application, to ensure that the selected model is appropriate for use within that environment, in line with the supplied instruction manual. In applications where cluster flies may be present, users must ensure that the use of a killing grid ILT is appropriate, whilst also regularly checking the catch tray and emptying as required, to avoid a build up of caught insects within the tray coming into contact with the killing grid.
